What is FEROTOP™?

“FEROTOP™” means TODA KOGYO's bonded magnet compounds for molding purpose that are composite of resins and magnetic powders. We have a wide variety of products portfolio regarding both hard and soft magnetic compounds as shown below, which has been adopted in various applications in various industries. Based on the knowledge accumulated on “FEROTOP™” for many years, we can customize the characteristic of magnetic compounds to meet the wide range of requests from customers.

“FEROTOP™” has the following features.

- Excellent processability, possible to mold into various sizes and complicated shapes with high dimensional accuracy.
- Flexible magnetic designs of waveforms by various ways of magnetization, including radial orientation and multi-pole magnetization (for hard magnetic materials).
- Integrated and simplified process achievable, by molding compounds and other parts at once.

Not only customizing the compounds' characteristics, but we can also design the compounds from its raw materials to meet customer's required specification, as we develop and manufacture magnetic powders by our own. Moreover, we have compound production bases located not only in Japan but also in China and Thailand so we can respond to the global demand from our customers.

FEROTOP™ lineup

Features

- ◆ **Excellent processability**
 - Possible to mold into various sizes and complicated shapes with high dimensional accuracy
 - Excellent strength and impact resistance
- ◆ **Flexibility to magnetization (hard magnetic material)**
 - Easy to adapt to multi-pole magnetizing such as radial orientation and complex magnetizing
- ◆ **Cost efficiency by integral molding**
 - Integrated and simplified process achievable, by molding compounds and other parts at once.
 - Possible to make anisotropic magnets with magnetic field orientation mold or magnetic field injection molding machine.

Item	Injection	compression	Sintered
Strength	◎	△	×
Weather-resistance	○	*△	*×
Magnetic force	△	○	◎
Accuracy of dimension	◎	△	△
Flexibility of design	◎	×	×
Integral molding	◎	×	×

*Compression and sintered may require coating such as plating.

Applications

◆ Process when using sintered magnets

Purchase of magnets	Applying of adhesive	Sticking magnets	Other processes	Rotor
			Thermosetting ↓ Magnetization	
Difficult to arrange the shape of magnets for intended application by your own.	Adhesion → The pasting process is required, which increases both production costs and labor costs.		Heating and magnetizing processes are required.	

◆ Process when using plastic magnets

Purchase of materials	Injection molding in a magnetic field	Other processes	Rotor
		Magnetization	
Possible to arrange the shape of magnets as intended by injection molding.	Possible to mold the magnetic materials directly to core shafts without using adhesive.(Orientation is required for anisotropic materials)	Magnetization process is required.(depending on the material)	

Injection molding machine

Partnership

- Optimized supply chain of group affiliates
- Proposal of total solutions for "the ultimate issues to solve"

Molded products

Powders

- Hard ferrite powders
- Soft ferrite powders
- NdFeB powders
- Metal powders

- ✓ Material development
- ✓ Control powder properties

Solution proposals
from powder supply
to application

Solution

- Analysis of magnetic field
- Support of magnet molding
- Support of prototype mold design

- ✓ Analysis technology
- ✓ Injection molding technology
- ✓ Mold design technology

Magnetic powders

Compounds

Composite with resin

- For injection (PA, PPS, EEA)
- For extrusion (EEA, SEBS)

- ✓ Powder optimization
- ✓ Surface treatment technology

Magnetic compounds

We have magnetic powders / compounds manufacturing facilities in Japan and various location overseas.
We can provide products from the nearest location of customer in order to meet the needs from the view of Business Continuity Plan (BCP), transportation efficiency and others.

The demagnetization curves at -40°C and 120 °C are calculated ones which are based on the actual demagnetization curve at 25 °C and following temperature coefficients.

Temp. (°C)	-40	120
α_{Br} (%/°C)	-0.19	-0.19
β_{Hcj} (%/°C)	0.14	0.14

◆ Orientation characteristics

- This is the result of measurement after orientation without magnetization.
- The orientation ratio of the anisotropic compound is calculated in comparison to the value at 700 kA/m as 100%.

◆ Magnetizing characteristics

- This is the result of measurement after the processing of (i) orientation at 700 kA/m, (ii) demagnetization, and (iii) magnetization.
- The magnetization ratio is calculated in comparison to the value magnetized at 3200 kA/m as 100%.

- Tensile strength and tensile elongation are the results measured at room temperature after the specified exposure time.
- The water absorption rate is the result calculated from the weight change of the dumbbell test piece before and after the specified exposure time.

- ▣ Test grade: TP-A27N (PA12), TP-S68 (PA6)
- ▣ Sample shape: Dumbbell test piece 175 x 12.5 x 3.2mm
- ▣ Exposure environment: 85 °C / 85% RH

* The values shown are values of central tendency.

Test grade : TP-A27N (PA12)

◆ Permanent flux loss is evaluated by magnetizing at 8640 kA/m after 1000h exposure.

◆ Orientation characteristics

- The orientation ratio of the anisotropic compound is the result measured by magnetizing at 6450 kA/m after orientation.
- The orientation ratio of the anisotropic compound is calculated in comparison to the value at 700 kA/m as 100%.

◆ Magnetizing characteristics

- The magnetizing characteristics of the anisotropic compound are the results after the processing of (i) orientation at 700 kA/m, (ii) demagnetization, and (iii) magnetization.
- The magnetization ratio of the anisotropic/isotropic compound is calculated in comparison to the value at 8450 kA/m as 100%.

Test grade : TRP-M760 (PPS)

Recycling flow

Recycling rate (%)	No.	B_r (mT)	H_c (kA/m)	H_{ci} (kA/m)	$(BH)_{max}$ (kJ/m ³)	MFR (g/10min)	Bending strength (MPa)	Tensile strength (MPa)	IZOD strength (kJ/m ²)
100	V	526	363	953	47.3	71	86	45	5
	R1	525	360	936	46.8	106	63	34	4
	R2	525	359	929	46.5	170	45	27	3
	R3	522	357	929	45.8	748	36	19	2
	R4	525	357	927	46.2	563	30	17	2

* MFR measurement conditions : 310°C/5kg

◆ Heat resistance in high temperature LLC environment

◆ Heat resistance in high temperature ATF environment

External appearance after immersion test

Even after immersion at 110 °C for 3000 hours, no rust occurred on molded product including the gate part of the molded product.

Before immersion

After soaking at 110 °C for 3000 hours

- Basically, NdFeB magnets are vulnerable to corrosion, so we apply rust preventive treatment on magnetic powders before compounding with resin.
- Our materials are enough resistant to corrosion for the use in submersible pump.

◆ Rust generation mechanism

Rust begins from the Nd-rich phase, then the main phase will be invaded. Since this reaction does not form a passivation film, it does not stop and eventually causes the loss of the main phase. Also, Br decreases at this state.

Fe ion elution amount (mol / L)			
	with surface treatment	without surface treatment	Magnification (without / with)
Elution amount	4.7×10^{-4}	2.6×10^{-5}	18.4

◆ Rust prevention to magnetic powders

【Prevention method】

Apply special surface processing to the magnetic powders to prevent physical contact with oxygen and water.

【Evaluation method】

Result of immersion testing is shown on the right, in which 1 gram of material (magnetic powders with/without surface treatment above) is soaked in catechol solution (50 ml at 23 °C /24 hr).

◆ Difference in corrosion resistance between compression molded magnets and injection molded magnets

The magnetic powders in bonded magnets are covered with more resin than those in compression magnets. This prevents contact with oxygen and water. Moreover, a skin layer is formed during molding which serves as preventive measure. The thickness of this skin layer changes depending on the injection conditions. You can select an appropriate mold design and injection conditions in order to obtain a sufficient skin layer for preventive purpose.

◆ Effect of skin layer

【Evaluation methods】

Immersion test in tap water (supplied in Otake, Hiroshima)

- Temperature: 26 °C
- Time: 100hr

Features

A soft magnetic compound that uses ferrite powders manufactured at our factory. Customer can combine the magnetic powders and resin as desired that suits your application. We will provide products with excellent processability that support the needs of miniaturization, complicated shapes and thinning on the customers' side.

Example of Application

- Suppression of electromagnetic noise
- Absorption of electromagnetic wave
- Magnetic shield
- Magnetic core

Property overview

Resin	Grade	Filler	Molding density	MFR	μ' at 10MHz	B at 786kA/m	Deflection temperature	Flexural strength	IZOD impact strength	Linear expansion coefficient
			ASTM-D792	ASTM-D1238	-	-	ISO75-2	ASTM-D790	ASTM-D256	JIS K 7197
			(g/cm ³)	(g/10min)	(-)	(T)	(°C)	(MPa)	(kJ/m ²)	(× 10 ⁻⁵ /°C)
PA12	SP-I247AEN	Magnetic powder	5.0	400 (270°C/5kg)	10.5	1.2	112	60	9	6.6
PA6	MC100LK31	Mn-Mg-Zn ferrite	3.3	55 (270°C/10kg)	16.5	0.2	172	120	6	4.1
PPS	SP-N736	Ni-Zn ferrite	3.6	40 (300°C/5kg)	16.4	0.2	215	95	5	2.2

* Direction flatwise, bending stress 1.82 MPa

◆ Preservation

- ✓ Avoid direct sunlight and high humidity; keep in a cool and dark place with stored in an airtight container.
- ✓ Nylon materials are required to be hermetically sealed, as they would take up moisture and their molding quality might be affected.
- ✓ Rare earth materials may deteriorate due to oxidation so make sure to keep hermetically sealed.
- ✓ Quality guarantee is valid for 6 months normally as long as the package is still unopened.

◆ Pre-drying

- ✓ In order to reduce drooling from the nozzle and stabilize the molding, dry compounds in advance as necessary. Drying conditions depend on your specification of the equipment and molded products.

Resin	Drying temperature(°C)	Drying time (hr)
PA12	60 ~ 100	2 ~ 8
PA6	80 ~ 120	3 ~ 12
PPS	100 ~ 120	2 ~ 8

- ✓ Pre-drying affects the molding conditions, appearance of molded product, and properties of products as shown in the figure below. Processability will be impaired if they are absolutely dried or overdried. Orientation characteristics and magnetic force of anisotropic materials may be harmed due to the change in fluidity.
- ✓ Drying conditions depend on the season and the specification of your product.

◆ Molding machine / mold design

- ✓ Please use abrasion resistance cylinders and screws for the molding machine.
- ✓ Provide gas drainage of the mold in all parts including product parts and runner parts.
- ✓ When magnetic field molding is performed, materials are attracted to the magnetic force therefore fluxional behavior might be affected. Please note that the weld position and gas drainage position are different from those of normal resin.

◆ Temperature setting

- ✓ The viscosity of magnetic compounds is fluctuated by the melting temperature and residence time. Excessive temperature or stagnation may cause solidification or decrease in strength due to deterioration of the resin.
- ✓ Be sure to purge immediately before molding. Once the molding machine stops or is blocked, it needs to be re-purged.
- ✓ Please be aware for pin gate molding that the gate sealing time is short and pressure after gate seal tends to cause problems such as runner removal.
- ✓ The mold temperature depends on the shape and thickness of molded products. Generally around 80°C for Nylon materials.

Resin	Cylinder temperature (°C)	Mold temperature (°C)
PA12	220 ~ 290	50 ~ 100
PA6	250 ~ 300	60 ~ 100
PPS	290 ~ 340	120 ~ 150

◆ Filling pressure

- ✓ Since the filler is filled higher than general resin, the products become solidified faster and higher pressure is required.
- ✓ Anisotropic materials tend to reach high magnetic force and become uniformized by shortening the filling time.

◆ Recycling

- ✓ When using recycled materials, please test in advance and pay attention closely to their quality. Also, please follow the above-mentioned instructions including preservation and pre-drying procedure of recycled materials.

Test		Test pieces	
For physical property (Strength)	Bending strength measurement	Shape: Flat plate WO (full width) : $12.7\text{mm} \pm 2$ T (thickness) : $3.2\text{mm} \pm 0.4$ LO (total length) : $80\text{mm} \pm 10$	
	Tensile strength measurement	Shape: Flat plate (dumbbell) W (width of thin part) : $13\text{mm} \pm 0.5$ WO (full width) : $19\text{mm} \pm 6.4$ T (thickness) : $3.2\text{mm} \pm 0.4$ LO (total length): maximum 175mm G (gauge length) : $50\text{mm} \pm 0.25$ L (length of thin part) : $57\text{mm} \pm 0.5$ D (distance of grip) : $115\text{mm} \pm 5$	
	Izod impact strength measurement	Shape: Flat plate WO (full width) : $12.7\text{mm} \pm 2$ T (thickness) : $3.2\text{mm} \pm 0.4$ LO (length) : $60\text{mm} +$	
	Ferrite / Isotropic rare earths compound magnetic property measurement	Shape: Cylinder ϕ (diameter) : 25mm h (height) : 10mm	
For magnetic property	Anisotropic rare earth compound magnetic measurement	Shape: Cylinder ϕ (diameter) : 10mm h (height) : 7mm
